

FSRH CEU Guidance: Recommended Actions after Incorrect Use of Combined Hormonal Contraception (e.g. late or missed pills, ring and patch) (March 2020)

Missing combined hormonal contraception (CHC) removes the suppressive effects of contraceptive steroids on ovarian follicle growth, thereby risking ovulation and conception. Women using CHC who miss combined oral contraceptive pills (COC) or make mistakes with their combined vaginal ring (CVR) or combined transdermal patch (CTP) are at increased risk of pregnancy compared with women who use CHC perfectly.

This document guides management when a woman has made a mistake using:

- ▶ [combined oral contraceptive pills](#) (see page 2)

This guidance for combined oral contraception applies only to monophasic ethinylestradiol (EE) COC containing 20-35mcg EE and designed to be taken as a 21/7 regimen *without* placebo pills. It does not apply to Eloine[®] (24/4 regimen EE/drospirenone), Zoely[®] (24/4 regimen estradiol/ norgestrel acetate) or Qlaira[®] (estradiol valerate/ dienogest).

- ▶ [combined vaginal ring](#) (see page 3)
- ▶ [combined transdermal patch](#) (see page 4)

CHC that is designed to be used in the standard way (i.e., COC in 21/7 regimens with 21 active pills followed by a 7 day pill-free interval; ring in place for 21 days followed by 7 ring-free interval; patch replaced weekly for 3 weeks followed by 7 patch-free days) can be used with the standard seven day hormone-free interval, with a shortened hormone-free interval or with omission of the hormone free interval. This guidance is designed to apply if mistakes are made with any of these regimens.

For further information see [FSRH Clinical Guideline Combined Hormonal Contraception](#).

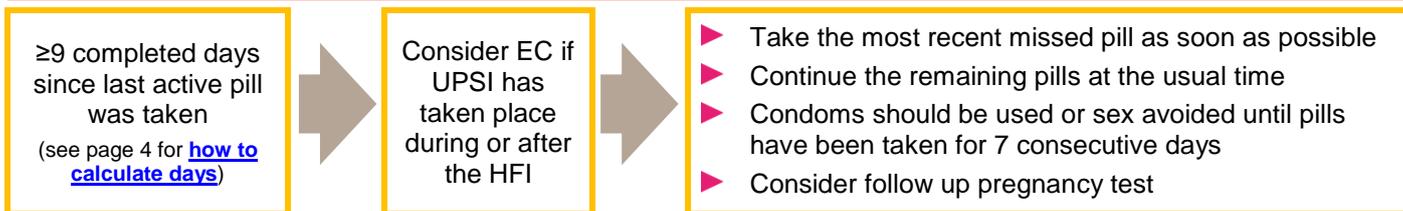

If a woman uses CHC incorrectly she should be made aware that contraceptive effectiveness depends on reliable use. Offer alternative effective contraceptive methods (including LARC).

When emergency contraception (EC) is being considered, see [FSRH Clinical Guideline Emergency Contraception](#) Section 18 (What Should Women be Advised Regarding Future Contraception?) to support decision-making on type of EC and recommendations for follow-up actions such as CHC method restart, additional protection and pregnancy testing.

It should be noted that if CHC is not used correctly there is a potential risk of pregnancy even if these recommended actions are followed.

Guidance on actions after incorrect use of combined oral contraception (monophasic ethinylestradiol COC without placebo pills only)

Late restarting after HFI

1 missed pill (48 to <72hours since last pill in current pack was taken)

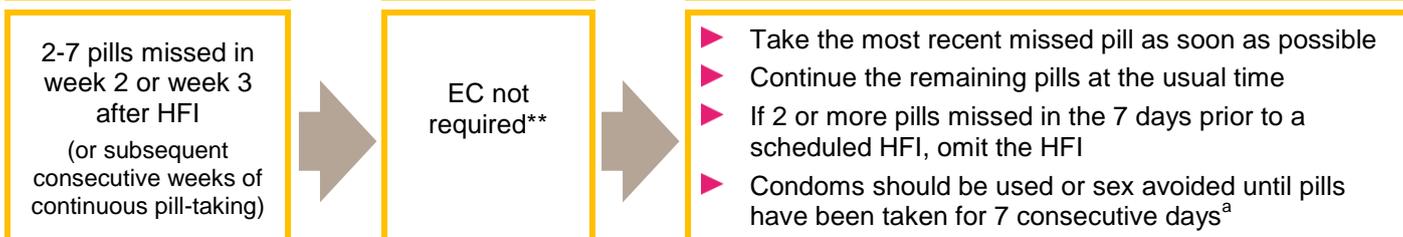

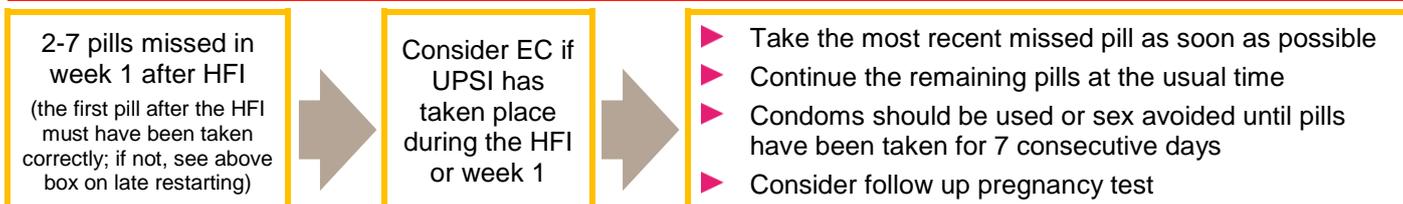

* if consistent, correct use earlier in week 1 and the 7 days prior to the HFI

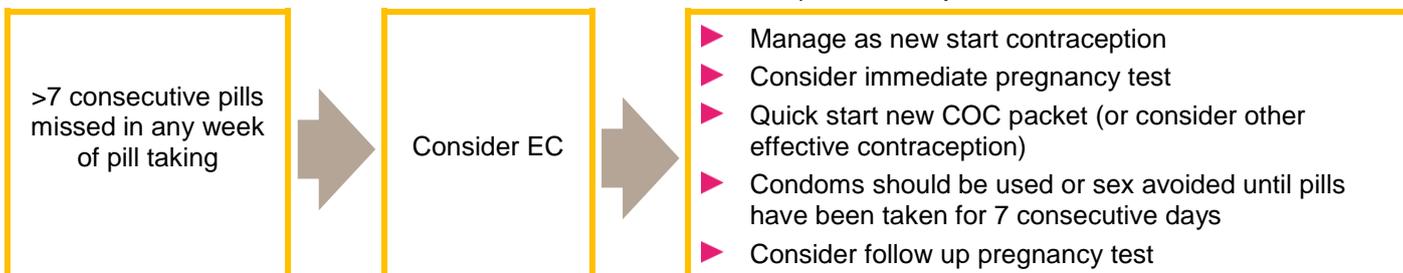

**if consistent, correct use in the previous 7 days

2 or more missed pills (≥72 hours since last pill in current pack was taken)

**if consistent, correct use in the previous 7 days

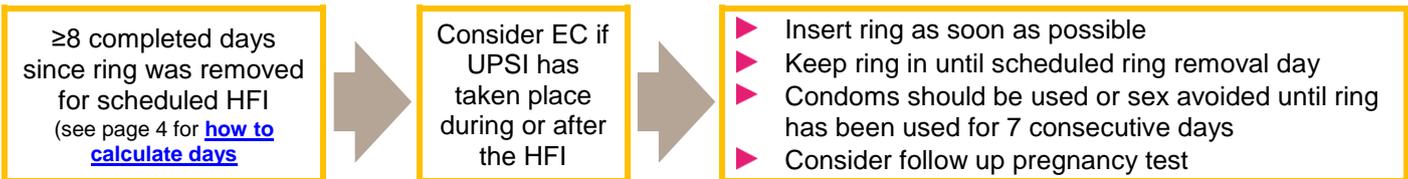

^a Overcautious, but a back-up in case of subsequent incorrect use

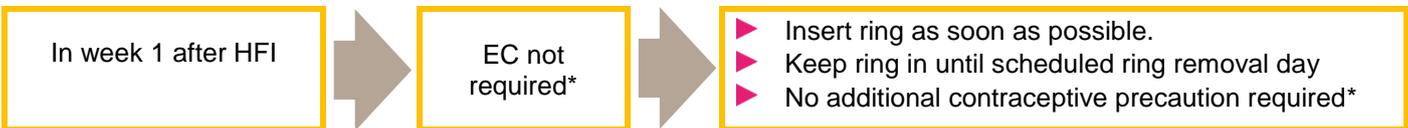

Abbreviations: COC, combined oral contraception; EC, emergency contraception; HFI, hormone-free interval; UPSI, unprotected sexual intercourse

Guidance on actions after incorrect use of the combined vaginal ring

Late restarting ring after scheduled HFI

Unscheduled ring removal for <48 hours

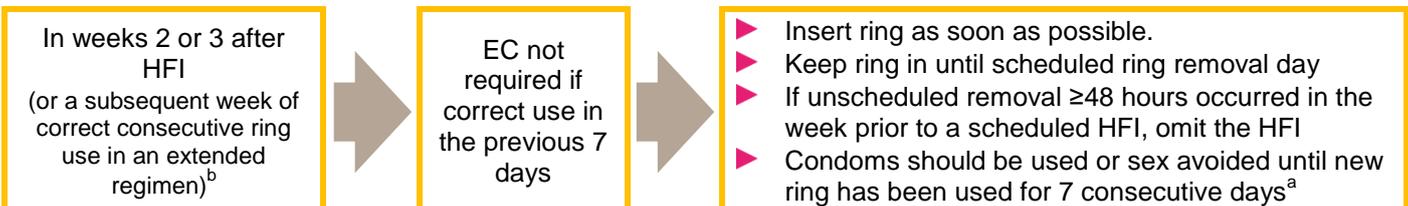

* if correct use earlier in week 1 and the 7 days prior to the HFI

** if correct use in the previous 7 days

Unscheduled ring removal for ≥48 hours

Accidental continued use of the same ring beyond 3 weeks

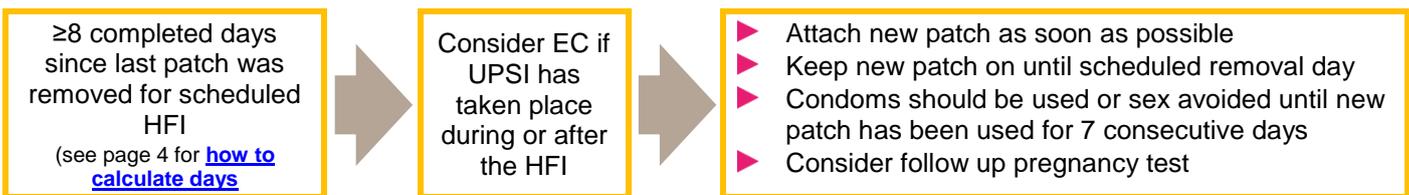

^a Overcautious, but a back-up in case of subsequent incorrect use

^b Theoretically this could apply to up to 7 consecutive days unscheduled ring removal, but evidence is lacking

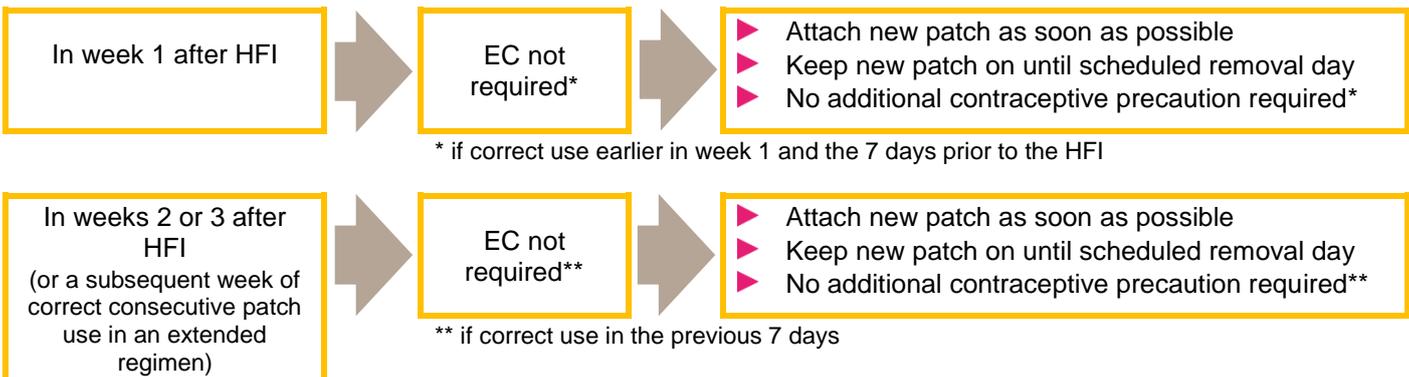

Abbreviations: EC, emergency contraception; HFI, hormone-free interval; UPSI, unprotected sexual intercourse

Guidance on actions after incorrect use of the combined transdermal patch

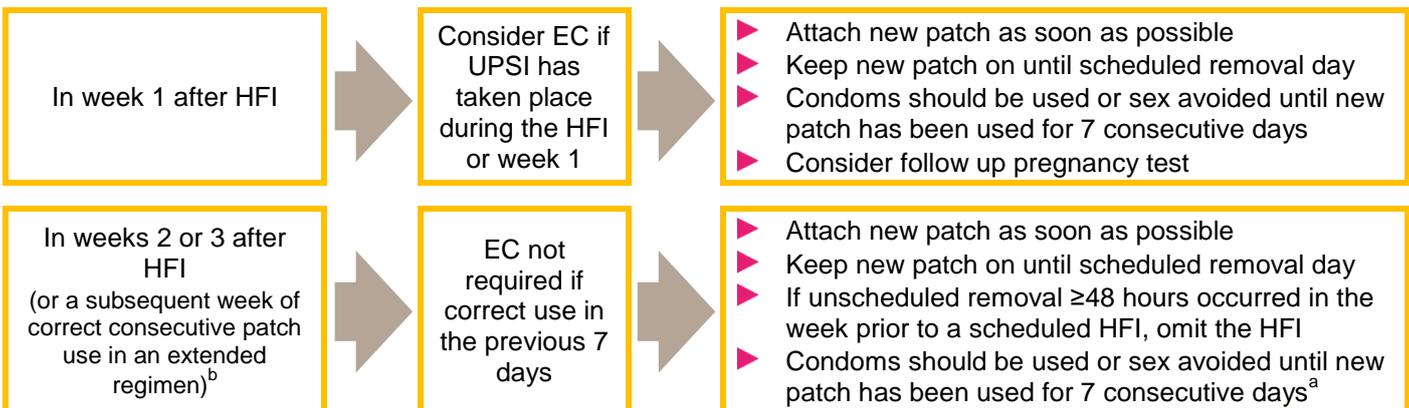

Late restarting patch after scheduled HFI

Unscheduled patch detachment for <48 hours or continued use of same patch for up to 48 additional hours

Unscheduled patch detachment for ≥ 48 hours or continued use of the same patch for ≥ 48 additional hours

^a Overcautious, but a back-up in case of subsequent incorrect use

^b Theoretically this could apply to up to 7 consecutive days unscheduled patch removal, but evidence is lacking

Abbreviations: EC, emergency contraception; HFI, hormone-free interval; UPSI, unprotected sexual intercourse

How to calculate late restart after a hormone-free interval (HFI) for pill, ring or patch

Pill: If a woman took her last pill before a HFI at 9am on Monday, so long as she restarts before 9am on Wednesday of the following week (just less than 9 days later) she does not need to take additional action. If she starts at or after 9am on the Wednesday of the following week (9 days or more later) additional action is required. For pills, the HFI is considered to start 24 hours after the last pill is taken.

Ring or patch: If a woman removed her ring or patch before a HFI at 9am on Monday, so long as she inserts the new ring or applies the new patch by 9am on Tuesday of the following week (just less than 8 days later) she does not need to take additional action. If she restarts after 9am on Tuesday of the following week (8 days or more later), additional action is required. For the ring or patch, the HFI is considered to start at the time the ring or patch is removed.
